

# NX & MICRO FRONTENDS

CONCEPTS

DDD

MODULE  
FEDERATION

What is and  
why NX?

# What is NX?

Nx is a suite of **powerful, extensible** dev tools that help you **develop, test, build**, and **scale** Angular applications with fully integrated support for modern libraries like Jest, Cypress, ESLint, NgRx, and more.

# Why NX?

1.

Drive good  
architecture

2.

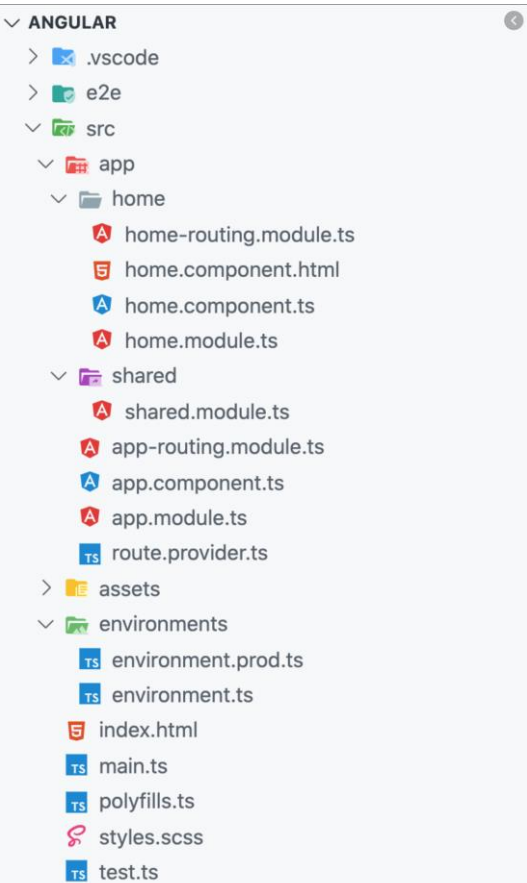

Modern  
Tools

3.

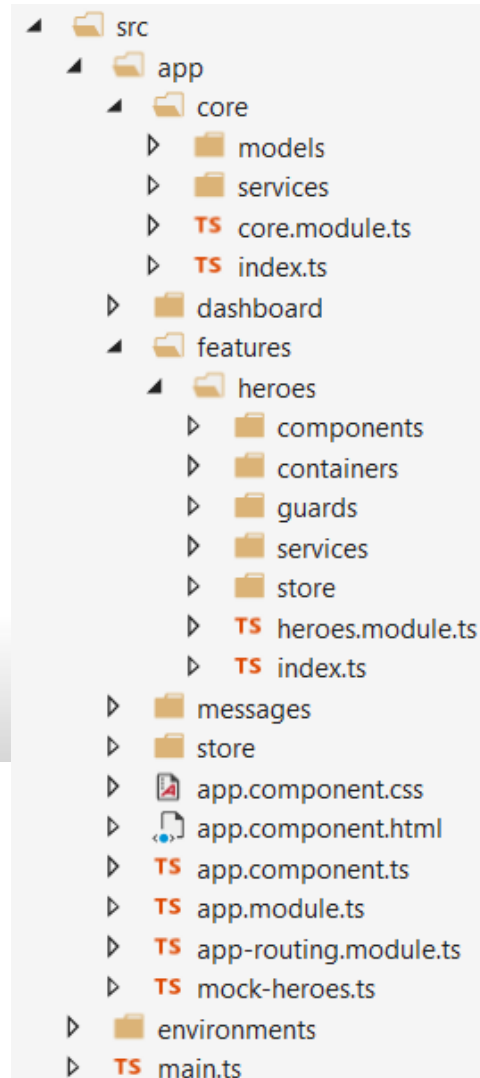

Scalability &  
speed

# 1. Good Architecture

## Common angular/cli architecture

*One big monolith  
with a set of folders,  
functioning as  
feature boundaries*

*What's intended to  
be “public” outside  
of the feature?*

*What's private and  
should not be re-used  
across features?*

# Workspace Libs Architecture

Export what should be public api

Create boundaries with libraries is  
**stronger** than do it with folders, and  
help you think more of what you want  
to expose in their APIs

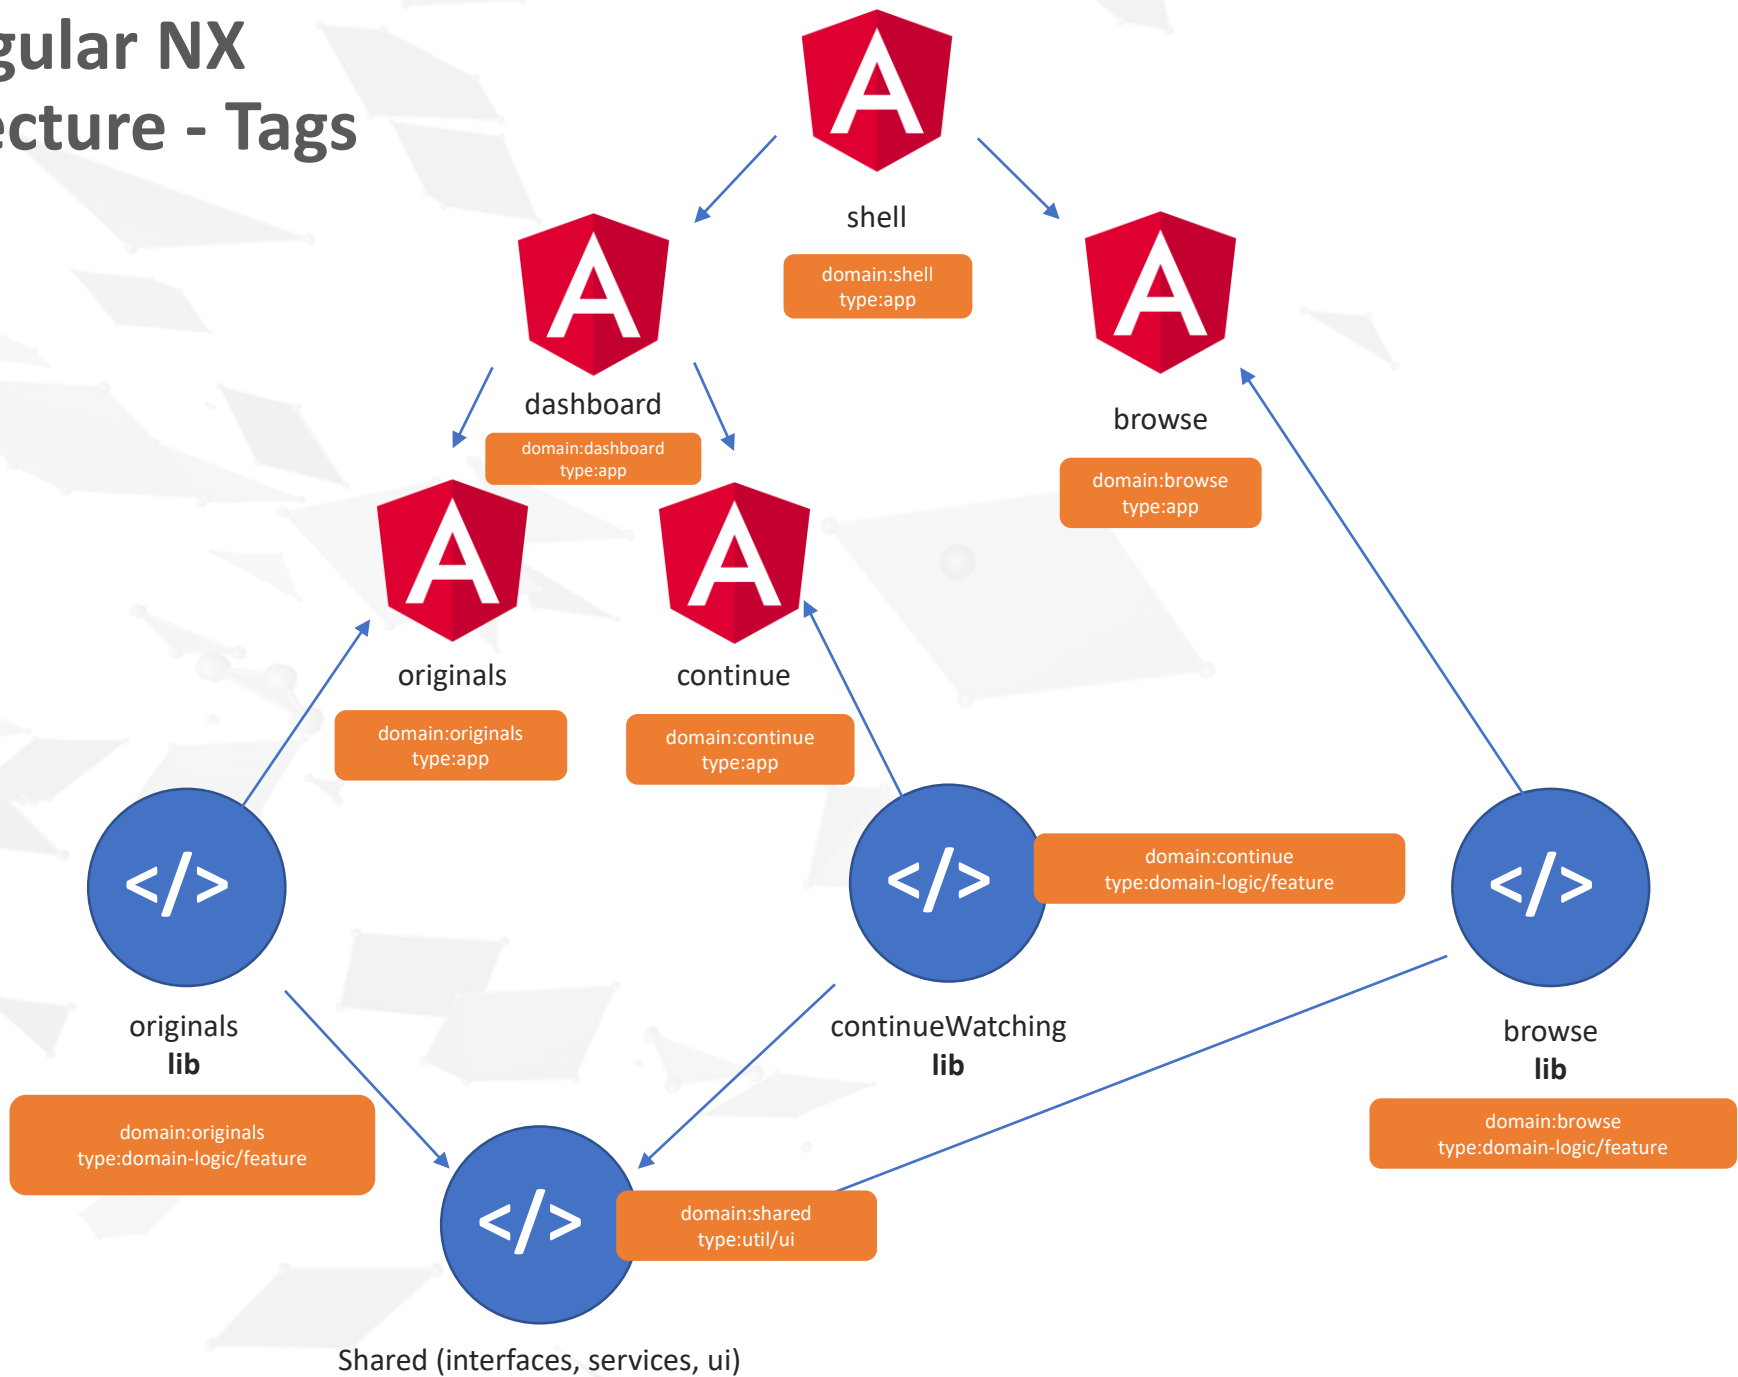

Create boundaries with libraries is  
**stronger** than do it with folders, and  
help you think more of what you want  
to expose in their APIs

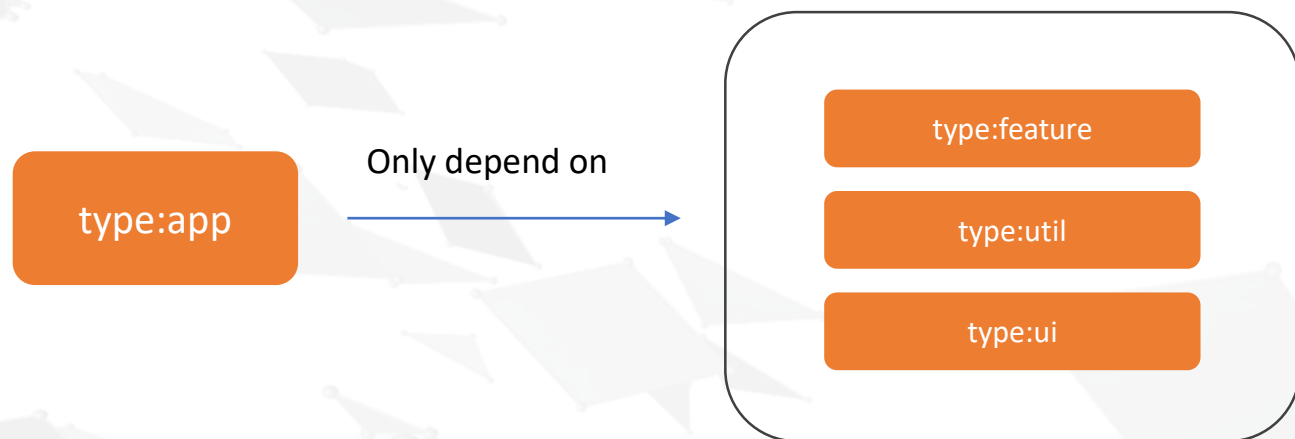

**BUT! How can we  
enforce that?**

# Restricting dependencies

# Restricting dependencies

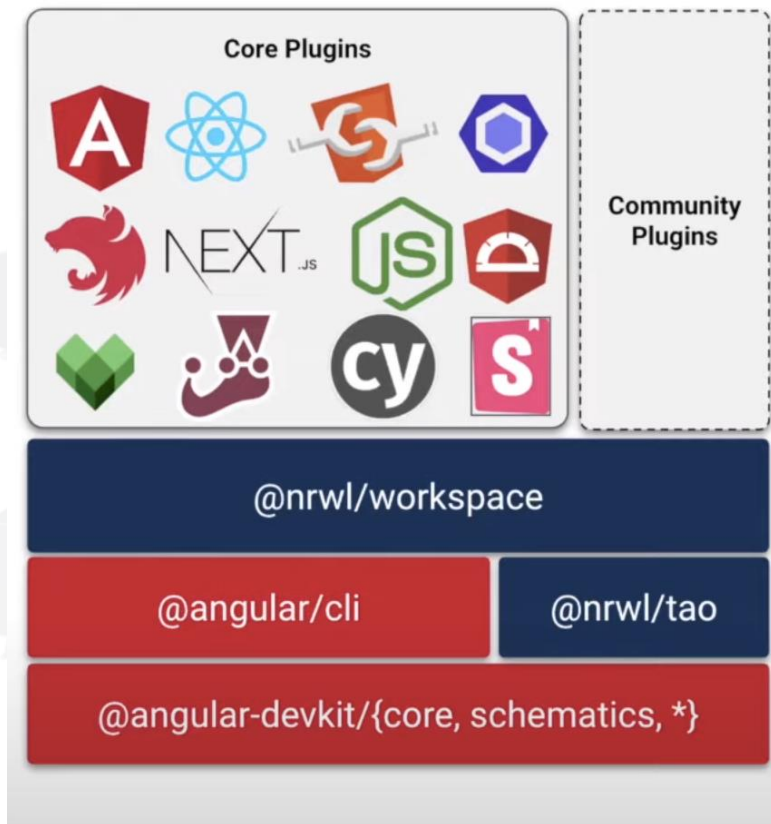

DEMO

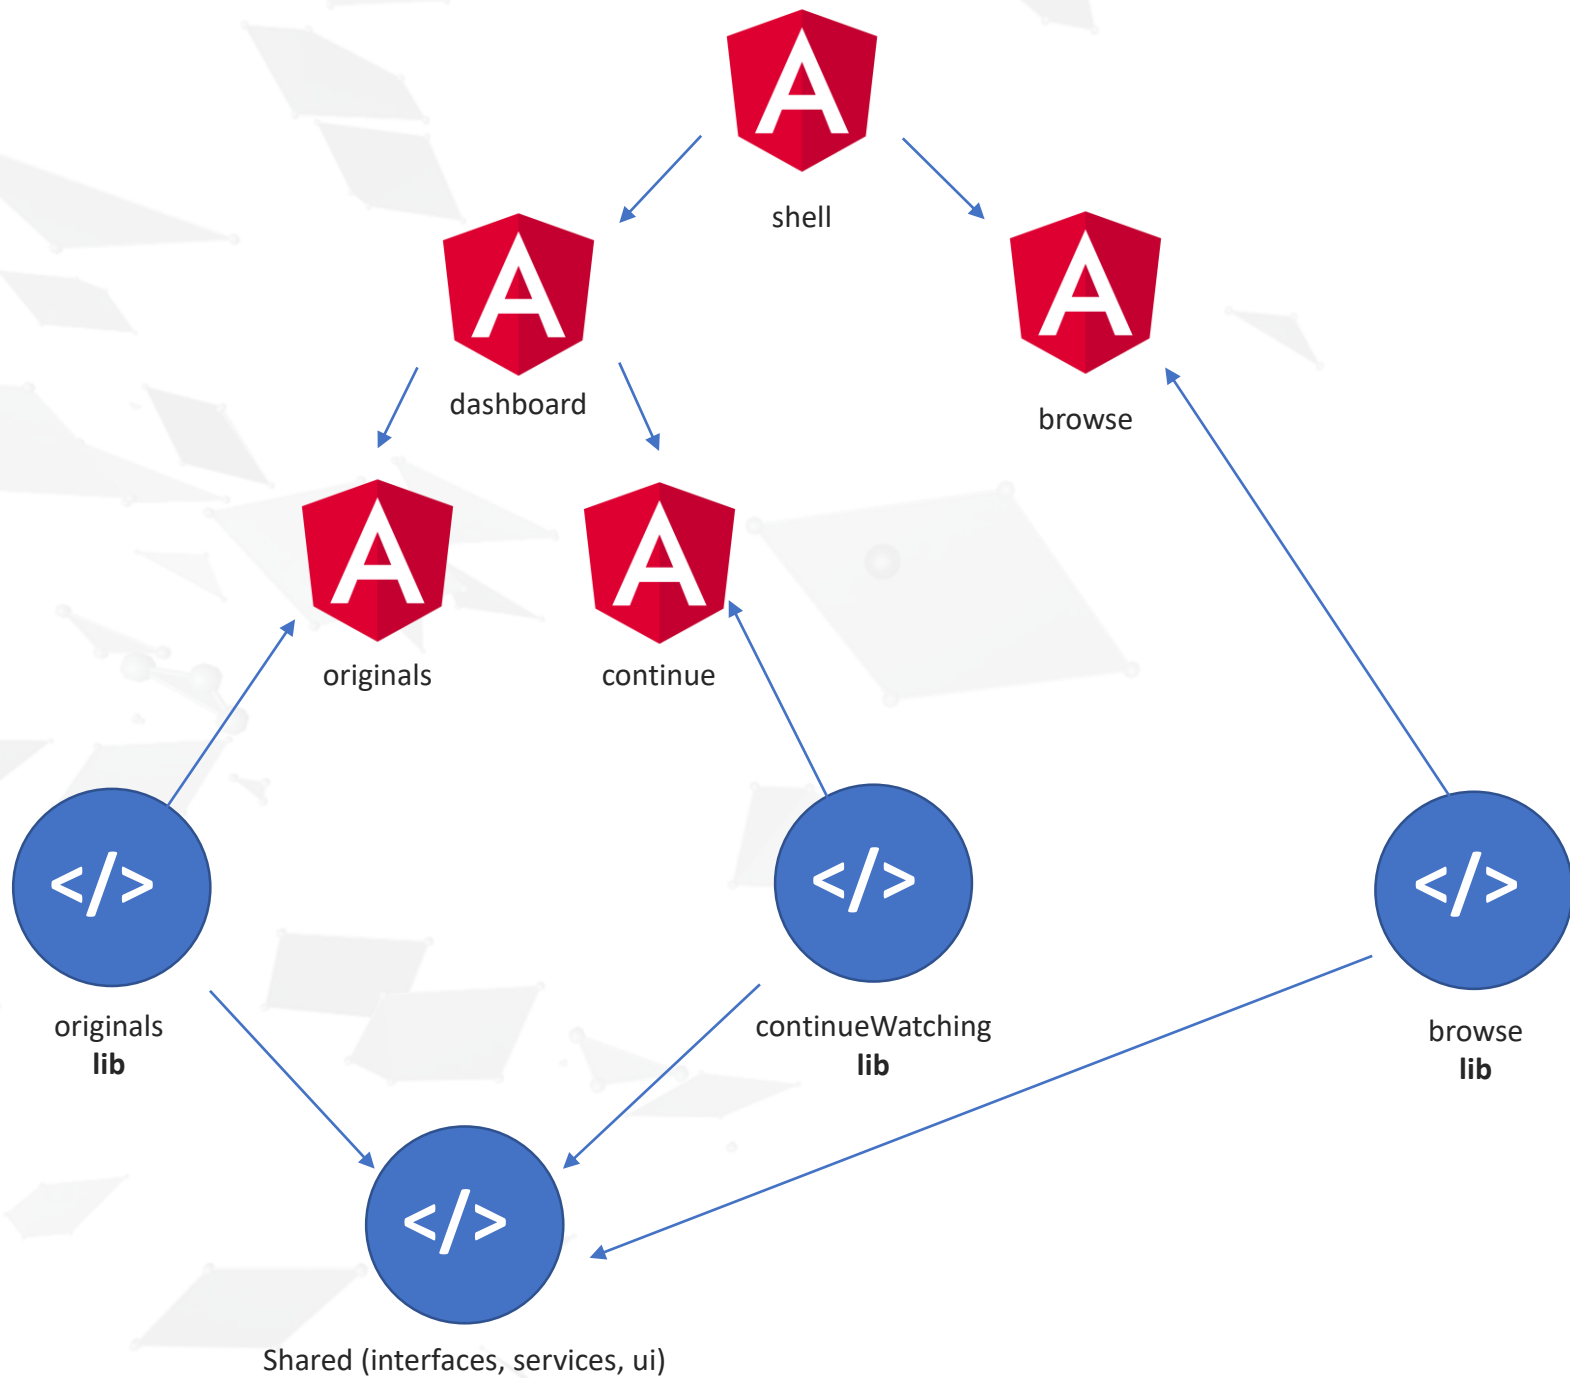

## 2. Modern Tooling

- Comes with eslint (tslint – deprecated)
- Prettier for code formatting
- **Jest** – Unit tests (karma)
- **Cypress** – E2E tests (Protractor)

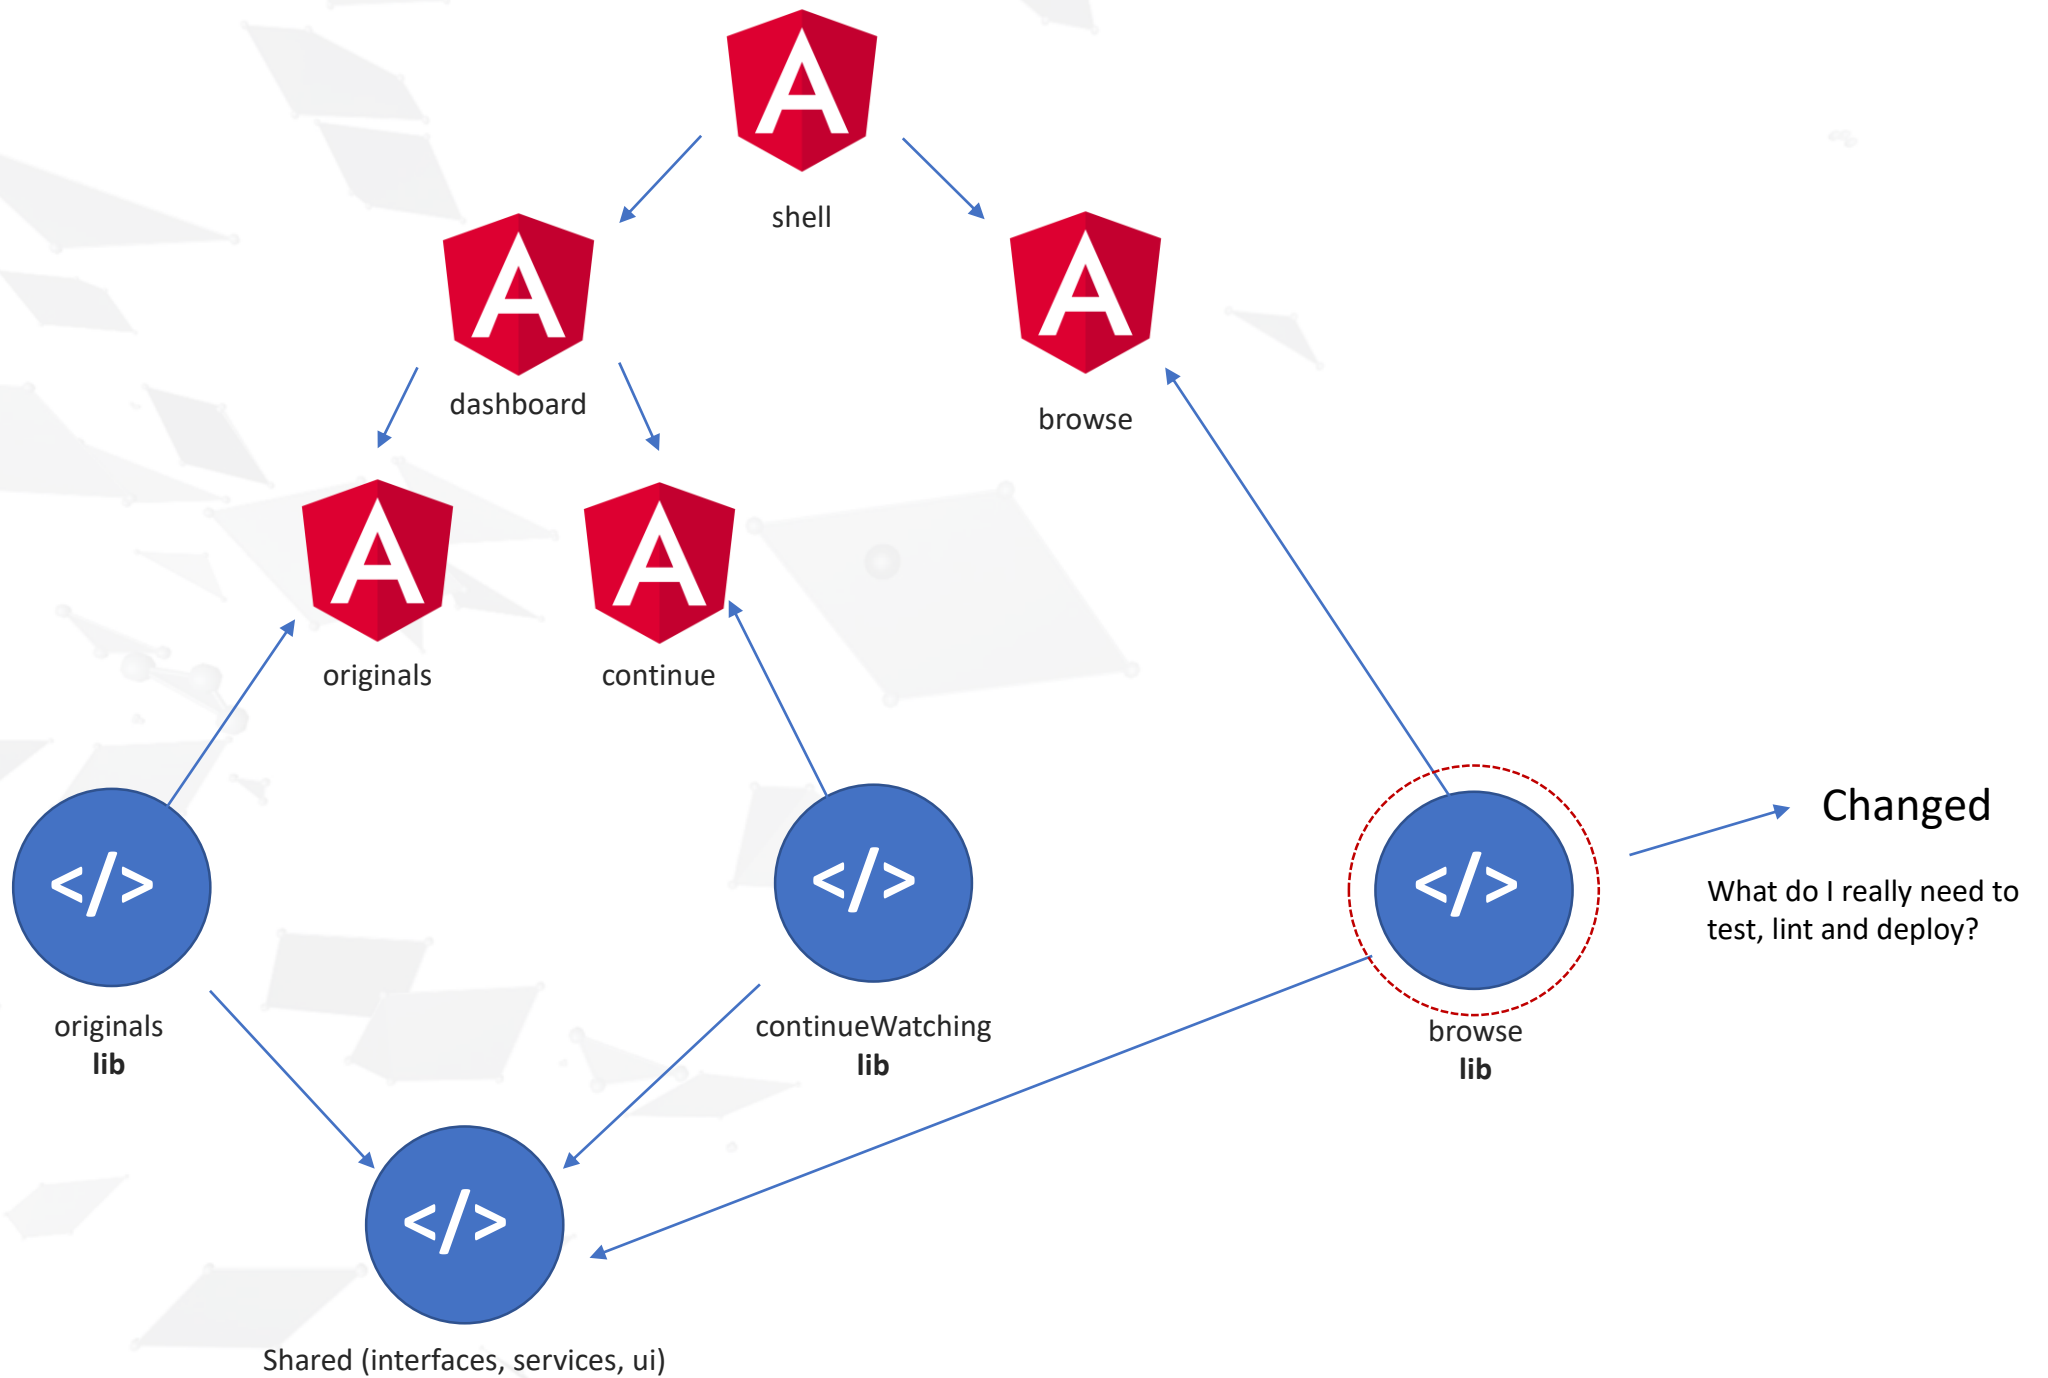

### **3. Scalability & speed**

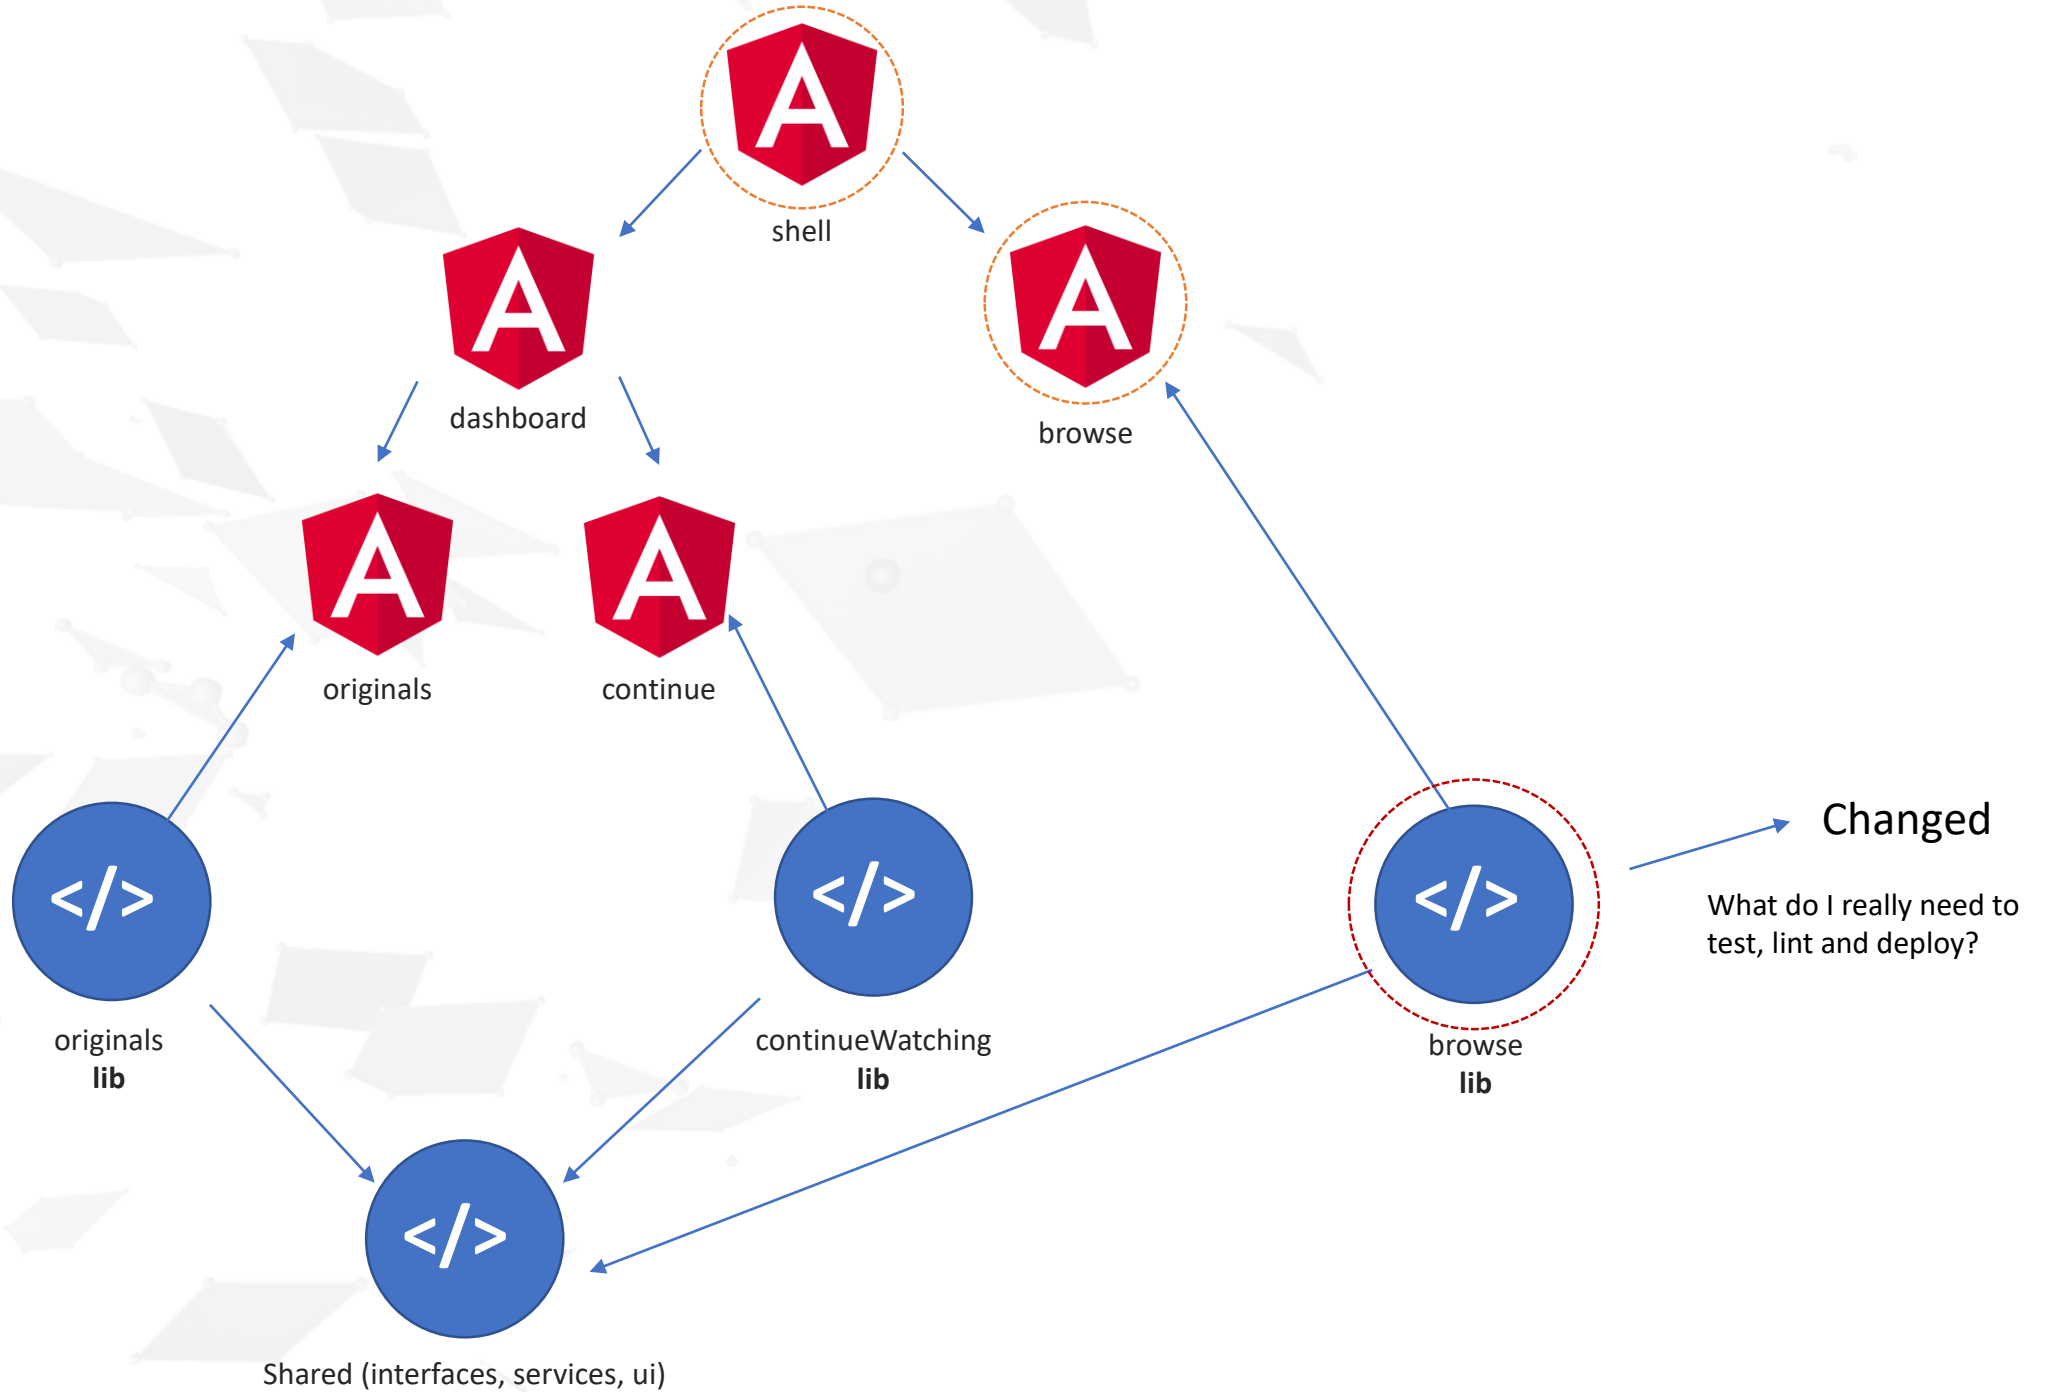

Do I need to always **deploy, test and lint** everything?

With ***nx affected*** command you can test, deploy and lint only the projects that is affected by the change.

The background features a light gray grid of squares. Overlaid on this grid are various geometric shapes, including triangles, diamonds, and polygons, in a slightly darker gray. Some of these shapes have small circles at their vertices. The overall aesthetic is clean and modern.

DEMO

Where is the **Microfrontends** here?

**Let's talk shortly about Webpack 5 and Module Federation.**
